

AFFORDANCES OF ARCHITECTURAL TYPOLOGY

ANDREAS LECHNER

Affordances of Architectural Typology is the concept for a design-driven research reflection that seeks to explore and further design strategies that are aiming at Resilient building structures but are quintessentially architectural in nature. As material composition enabling inhabitation, buildings are mediations between forms and functions. From the combination of the professors' expertise, an innovative approach to Resilient Architectural Design and Re-Use lies at the core of this course, that not only re-evaluates the key insights of post-functionalist critique – i.e. spatially well-articulated buildings (architecture) with high typological qualities, can host many uses and therefore possess strong resilience. This combination also critically updates this insight for today's climate-positive design challenge.
